How to install Node.js

by *Shuichi Ohtsu*

Voice Data

This time, I will show you how to install Node.js on Ubuntu installed on *WSL*.

For this method, please refer to Mr. Takahashi's post to Qiita on July 31, 2018, "Install the latest Node.js on Ubuntu without difficulty".

For details, refer to the PDF file of Narration & Reference.

First from the Ubuntu command line, type `sudo apt-get install -y nodejs npm`.

You can also use `apt install` as `apt-get install`.

This installation takes a considerable amount of time.

First, clean the cache of npm.

Type `sudo npm cache clean`.

Next, using this npm, install *n* which is a version management tool of Node.js.

Type `sudo npm install n -g`.

Next, *n* is used to install the latest version of Node.js.

Type `sudo n stable`.

Based on the installed file, create a symbolic link.

Type `sudo ln -sf /usr/local/bin/node /usr/bin/node`.

Now check the version of Node.js.

Type `node -v`.

It is OK.

Next, delete the old Node.js and npm installed first to avoid confusion.

Type `sudo apt-get purge -y nodejs npm`.

You can also use `apt purge` as this `apt-get purge`.

Again confirm that you can use Node.js and Npm.

Type `sudo node -v`.

Type `sudo npm -v`.

It is OK.

Node.js has been installed.

Thank you for your watching.
