How to install Docker for Windows

by Shuichi Ohtsu

Operating environment

This time, I will show you how to install *Docker* on Windows.

Here, I will show you how to install Docker for Windows.

To use Docker for Windows, it is necessary to support Hyper-V with Windows10 Pro/Enterprise/Education.

First, we are going to check the operating environment.

Type Windows key + x to open the system menu and select Task Manager.

Next, click Performance tab menu.

Then, numerical values such as usage rate and speed are displayed under the graph, so make sure that virtualization is enabled in that.

If it is disabled, enable virtualization with the BIOS setting of the machine.

Install Docker for Windows

Next, open the download site of *Docker for Windows* in the browser.

That URL is https://store.docker.com/editions/community/docker-ce-desktop-windows.

The Get Docker button is displayed on the right side, so click on it to start the download.

When the download is finished, open the folder you downloaded.

Then Docker for Windows Installer.exe will be displayed.

Double click on it to start the installation.

When installation is completed, click the ^ icon on the right side of the task bar.

And if the icon of Docker is displayed and Docker is running is displayed, the installation is successful.

If Docker icon is animated, it is running Docker, so wait until the animation ends.

Configulation

Next, right-click the Docker icon to open the pop-up menu.

Then select Settings.

A setting window will open, so make various settings here.

On the screen, when you open the General menu, the last check item, Expose daemon on tcp://localhost:2375 without TLS is on.

If you want to execute the Docker command from WSL(Windows Subsystem for Linux), check it.

Close the setting window with the Close button on the upper right.

Check the version

Next, check the version of Docker installed.

On the command line, type docker version.

It is OK.

Installation of Docker for Windows is completed.

Thank you for your watching.
